

**COMMONWEALTH OF MASSACHUSETTS**  
**DEPARTMENT OF TELECOMMUNICATIONS AND ENERGY**  
**D.T.E. 03-121**

PREFILED DIRECT TESTIMONY OF  
THOMAS W. SMITH  
OF EQUITY OFFICE PROPERTIES (“EOP”)  
MARCH 16, 2004

DIRECT TESTIMONY OF THOMAS W. SMITH  
D.T.E. 03-121

1    **Q.     Please state your name, occupation and business address.**

2           I am Thomas W. Smith. I am Vice President – Energy Operations for Equity  
3           Office Properties Trust. My business address is Two North Riverside Plaza,  
4           Suite 2100, Chicago, Illinois 60606.

5    **Q.     Please describe your qualifications.**

6    A.     I am the Vice President of Energy Operations for Equity Office Properties.  
7           One of my main responsibilities is managing OSEP, L.L.C., a business unit  
8           EOP created to design, engineer, construct, operate and maintain cogeneration  
9           systems within EOP's portfolio of properties.  
10          Prior to joining EOP, I have served as President of Americas Power Partners,  
11          Managing Partner of Alternative Energy Consultants, VP of Project  
12          Development for Polsky Energy Corporation, VP of Sales and Marketing for  
13          US Turbine, National Sales Manager of International Power Technology and  
14          various positions within Westinghouse Electric Corporation. I have been  
15          involved with the power generation industry for over 22 years and hold a BS  
16          degree from Miami University in Oxford, Ohio.

17

18   **Q.     Please describe the nature of Equity Office Properties' business.**

19   A.     EOP is the largest owner and operator of commercial real estate in the  
20          country. Currently, EOP owns and operates 684 office buildings in 27 U.S.

DIRECT TESTIMONY OF THOMAS W. SMITH  
D.T.E. 03-121

1           markets, has over 2,400 employees and a market capitalization of over \$25  
2           billion.

3   **Q.   Does EOP have any properties in Boston?**

4   A.   EOP currently owns 54 commercial office buildings in Boston with almost  
5           13,000,000 square feet of rentable space. EOP is actively looking to acquire  
6           and develop other properties in Boston to improve its presence in the  
7           commercial real estate market.

8   **Q.   What is EOP's position on combined heat and power ("CHP")?**

9   A.   EOP is committed to CHP. The company has identified six major U.S.  
10          markets that possess the appropriate conditions to pursue CHP. These  
11          markets include Chicago, Boston, New York, Los Angeles, San Diego and  
12          San Francisco. EOP selected markets with a sizeable commercial portfolio,  
13          where favorable financial conditions exist and economic incentives are  
14          available. The company is in the process of analyzing its buildings in each of  
15          these markets to identify potential candidates for CHP, and we expect to find  
16          50 – 100 buildings that can benefit from the CHP strategy.

17   **Q.   What is the current status of EOP's CHP program?**

18   A.   EOP presently has three projects online, representing 3,000 kW, fifteen  
19          projects in active development, representing 9,030 kW and six projects in pre-  
20          development stages totaling 6,530 kW. To date, EOP has committed almost

DIRECT TESTIMONY OF THOMAS W. SMITH  
D.T.E. 03-121

1           \$27,000,000 to the CHP effort and is pursuing almost \$7,000,000 in state and  
2           city incentives for these projects.

3   **Q.    What is EOP's assessment of the Boston CHP market?**

4   A.    As previously indicated, EOP is committed to the Boston commercial real  
5           estate market and to CHP projects within our Boston portfolio. EOP has  
6           analyzed a number of projects in our Boston portfolio, and a CHP installation  
7           would make economic sense in many of our buildings. Based on the current  
8           situation relative to the interconnection and standby charges, we are holding  
9           off on pursuing these projects.

10 **Q.    How does EOP select one of its buildings for a CHP installation?**

11 A.    Many factors are examined when selecting a market for CHP as well as the  
12           appropriate building within that market. The following is a basic summary of  
13           criteria considered:

- 14           1. Economics – Appropriate economic conditions within the market  
15                 must exist to warrant a capital investment. Typically, this means a  
16                 cost margin between the delivered cost of electric and thermal  
17                 energy (steam, hot water, chilled water, etc.) and the price of fuel,  
18                 typically natural gas.
- 19           2. Energy Load – The building needs to possess enough electric and  
20                 thermal energy load to implement a project. Typically, this  
21                 represents about 300 kW or greater on an electric side, and the

DIRECT TESTIMONY OF THOMAS W. SMITH  
D.T.E. 03-121

- 1 building must be able to utilize the exhaust heat from the generator  
2 for usable thermal energy requirements.
- 3 3. Tenant Power – In many EOP buildings, tenants have expressed  
4 interest in pursuing emergency backup electricity in case of a  
5 power outage. In order for tenants to benefit from such a project,  
6 EOP is attempting to select buildings where a CHP plant can play  
7 a dual role of supplying cost-effective energy in normal conditions  
8 as well as backup power in emergency circumstances.
- 9 4. Site Conditions – The building must have adequate space to  
10 accommodate the CHP system and be able to interconnect with  
11 required utilities (electric, natural gas, steam, hot water, chilled  
12 water, cooling and exhaust).
- 13 5. Incentives – In order to help stimulate the market, develop  
14 economies of scale and mitigate perceived risks, EOP has also  
15 focused on markets that offer CHP incentives.
- 16 6. General CHP Environment – EOP believes CHP will be an asset to  
17 our tenants, stockholders and the general population within the  
18 markets because of its efficiency, improved emissions (compared  
19 to conventional plants) and electric grid support. Given this  
20 methodology, EOP is looking for markets in which governments  
21 and energy-related parties (i.e. utilities) are supporting CHP.

DIRECT TESTIMONY OF THOMAS W. SMITH  
D.T.E. 03-121

1    **Q.    How does EOP determine the size of CHP projects within a building?**

2    A.    EOP is in the CHP business for the long-term, so our main focus is efficiency.  
3           We analyze the building's electrical load and compare it to the thermal  
4           requirements. Based on the outcome of this analysis, we size the CHP system  
5           to have the best overall system efficiency. Typically our systems will handle  
6           25 – 35% of the buildings electrical and thermal requirements.

7    **Q.    What is EOP's assessment of the CHP market in Boston?**

8    A.    In general, the CHP market in Boston seems favorable; the economics are  
9           attractive, the cost of delivered electric power and thermal energy (steam), as  
10          compared to our long-term outlook for natural gas (CHP fuel source), creates  
11          a savings opportunity to support the estimated capital investment. Some of  
12          the buildings within EOP's Boston portfolio have the space and site conditions  
13          to support CHP. There are tenants interested in receiving backup power from  
14          CHP plants, if technically possible. The state and local government agencies  
15          are helping to promote CHP. There are also incentives available for installing  
16          efficient combined heat and power systems.

17               While it appears that there are standards for connection of smaller  
18          cogeneration facilities within radial systems, these interconnection standards  
19          most likely will not apply to most of the situations in which our facilities  
20          would interconnect, either to larger facility sizes and/or to network  
21          applications. Based upon our initial assessment, we would welcome further

DIRECT TESTIMONY OF THOMAS W. SMITH  
D.T.E. 03-121

1 efforts to standardize and facilitate interconnection arrangements in network  
2 situations and for larger sizes, such as in California and other states.

3 **Have there been any changes with the local utilities that may make EOP**  
4 **rethink its initial position?**

5 A. Yes; NSTAR has proposed so-called standby rates. After analyzing the  
6 proposed rates, we have concluded that if adopted, the proposed NSTAR rates  
7 will likely preclude EOP from installing CHP facilities within its Boston  
8 properties. Simply put, these proposed rates will reduce or eliminate much of  
9 the energy savings that we could hope to realize.

10

11 **Q. What is your Opinion of NSTAR's standby rates?**

12 A. There is no question that the NSTAR standby rates will raise the cost of  
13 obtaining standby service for customers seeking to install distributed  
14 generation. This rate increase will deter cost effective CHP and will send  
15 inappropriate price signals to customers. The rates are based on faulty and  
16 false assumptions, and are wholly unsupported by relevant cost and load data.  
17 The proposed rates are supported not by any actual experience but rather by  
18 broad generalizations and speculation about how CHP systems are designed  
19 and operated.

20

21 **Q: What aspects of the proposed rates do you object to and why?**

DIRECT TESTIMONY OF THOMAS W. SMITH  
D.T.E. 03-121

1

2       A:     First, the NSTAR standby rates are largely based on a customer's  
3       "contracted demand," to be set at the "generating capability or expected  
4       output" of the customer's CHP system. This proposal constitutes a full  
5       demand ratchet. We oppose the use of contract demand and/or demand  
6       ratchets because they are very blunt rate design tools. In this case the  
7       proposed rates will discourage cost-effective CHP and lead to over-charging  
8       customers who could otherwise benefit from installing CHP. Moreover,  
9       demand ratchets discourage efficient management and conservation of energy  
10      because unlike a demand charge based on actual usage, if we know we are  
11      paying a fixed amount regardless of how or when we operate our equipment,  
12      we there are no price signals that can influence us to adjust behavior to actual  
13      market conditions.

14           Second, NSTAR alleges that they incur the same costs whether a  
15      customer installs CHP or not. If this were the case, then the rates should be  
16      the same. If we apply the NSTAR rates to some of our properties in the  
17      Boston market, we see the anomalous situation where we could pay a higher  
18      charge for distribution service for a building with CHP than we would pay for  
19      an identical building without CHP. We think it is absurd to charge a customer  
20      more while providing less. Simply put, rates should be the same until data  
21      supporting an alternate conclusion is available. We believe that an accurate

DIRECT TESTIMONY OF THOMAS W. SMITH  
D.T.E. 03-121

1 accounting of costs and benefits of CHP would result in standby customers  
2 paying less than comparatively situated all-requirements customers.

3 That having been said, we own and manage properties both with and  
4 without CHP systems installed. In our experience, the service characteristics  
5 of a building without CHP are often different from those of a building with  
6 CHP. The peak distribution system demands in our buildings without CHP  
7 are driven largely by weather and time of day. The peak distribution system  
8 demand of our buildings with CHP occur when our CHP systems are go  
9 down, which is largely a function of equipment failure or scheduled outage.

10 Moreover, many CHP operators, including EOP often design their  
11 systems with redundancy built in – e.g. serving an average 900 kW load  
12 requirement with 4X250 kW generators. Based on our understanding of  
13 NSTAR’s proposed rates, if we have a system with 4X250 kW generators, we  
14 would face a “contract demand” charge on all 1000 kW. This is not  
15 reasonable or fair because it fails to take into account the reality of how we  
16 operate our systems. Through smart and efficient operations, we can manage  
17 the back-up requirements to be a fraction of the total nameplate capacity of  
18 the system, because the probability of losing all 4 generators at the same time  
19 is highly remote.

20 Equally important, one would expect a high degree in peak usage  
21 diversity among CHP systems in different locations because CHP systems by

DIRECT TESTIMONY OF THOMAS W. SMITH  
D.T.E. 03-121

1           their nature are not inter-dependent.

2                       NSTAR rates ignore the benefits that CHP brings to the entire  
3           system. While they are running, our CHP systems will effectively increase  
4           the distribution system capacity and relieve congestion in constrained  
5           distribution areas. CHP can also act to reduce the wholesale price of  
6           electricity by subtracting from total system energy demand. CHP can be part  
7           of the solution to the challenges facing the electricity distribution system, but  
8           not if the rates for back-up, maintenance and supplemental distribution service  
9           are exclusionary, as we believe NSTAR's rates to be.

10                   We think the design of appropriate standby rates for the distribution  
11           companies in Massachusetts is a complex endeavor that will require time to do  
12           the job properly. Standby rate design should include several important  
13           aspects, including but not limited to: (1) accurate understanding of which  
14           costs are properly attributable to a customer who utilizes CHP and separation  
15           of such costs into fixed and shared components; (2) an accurate body of data  
16           to support underlying factual assumptions, particularly those regarding  
17           treatment of standby customers as a discreet service class; (3) appropriate  
18           measurement and consideration of benefits conferred by CHP to the  
19           distribution system; and (4) consideration of how CHP standby rates fit into  
20           the overall rate structures of the distribution utilities.

21

DIRECT TESTIMONY OF THOMAS W. SMITH  
D.T.E. 03-121

1   **Q.    Do you have other concerns about the proposed rates.**

2    A:    Yes, we are concerned that many of the terms and conditions in the proposed  
3           rates are unreasonable and ill-conceived. Moreover, there are important terms  
4           and conditions that should be part of the proposed rates. For example, the  
5           “Availability” section of each of the proposed tariffs states that the customer  
6           must furnish, at its own expense, a “connection whereby the Company can  
7           meter the power supplied by the [customer’s] Generation Units. All meters  
8           shall be owned, operated and maintained by the Company.” This requirement  
9           is not acceptable. We would not allow NSTAR to have meters on our  
10          equipment and it is not appropriate for the Department to dictate such a result.  
11          We would expect NSTAR to provide a meter to measure the power that  
12          NSTAR delivers to the building. It is not appropriate for NSTAR to measure  
13          our energy “behind the fence.”

14                 Second, the tariffs require six month’s written notice to cancel the  
15          service. This requirement could force us to pay fixed standby charges for six  
16          months after we disconnected our equipment. There is no basis for such a  
17          continuing charge. We also object to the requirement that we provide 36  
18          months prior written notice to transfer to non-firm standby service. While we  
19          would never take non-firm or standby “interruptible” service from NSTAR on  
20          the terms proposed in their testimony, we nonetheless object to this  
21          unnecessary and unreasonable imposition of a waiting period.

DIRECT TESTIMONY OF THOMAS W. SMITH  
D.T.E. 03-121

1           As for terms that should be part of the standby rates, we think that well  
2           designed standby rates will reflect the different types of service that CHP  
3           customers require, and be priced to reasonably reflect the costs of the services  
4           provided. Operators of distributed generation like EOP require different types  
5           of distribution service, including back-up, supplemental and maintenance  
6           service and even interruptible service. These services have different  
7           characteristics and accordingly cause different costs on the distribution  
8           company. For example, by failing to provide any specific differentiated terms  
9           for maintenance service, we think we could be over-charged when we  
10          schedule outages in advance. Similarly, NSTAR includes no specific terms  
11          for non-firm standby service and states in their testimony that such service  
12          would be offered at the rates and on the terms offered to firm all- requirements  
13          customers. It seems incongruous to charge a standby customer taking non-  
14          firm service the same rates as charged to all-requirements customers taking  
15          firm service.

16               Finally, the terms of service should exclude from billing demand any  
17          demands that are a result of the action or cause of the distribution company.  
18          For example, if the distribution company seeks that we operate our CHP  
19          systems in order to assist in reducing system load at times of peak demand, we  
20          should not be assessed demand charges based on metered demands at such  
21          times. Similarly, if our equipment is forced off-line and our billing demand is

DIRECT TESTIMONY OF THOMAS W. SMITH  
D.T.E. 03-121

1           increased as a result of faults or other occurrences on NSTAR's system that  
2           we did not cause and would not otherwise have incurred, then we should not  
3           be assessed demand charges based on such events.

4

5   **Q.    Are you concerned about the market remaining in a state of uncertainty**  
6           **pending establishment of final rates for customers who install CHP.**

7

8   A.    Absolutely, while we would prefer uncertainty to the punitive and  
9           exclusionary rates proposed by NSTAR, we would urge the Department to  
10          establish a grandfather clause that maintains the applicability of current rates  
11          and then set a firm date for the imposition of any new standby rates that is  
12          sufficiently in the future so that parties who are planning CHP now can  
13          continue with certainty regarding the rates they will face. It is not sufficient to  
14          set a date that takes effect immediately upon adoption of the tariff, because  
15          parties can't plan in the interim while the rates are sorted out. Needless to  
16          say, a retroactive rate would be unfairly punitive.

17

18   **Q.    Have you formed any conclusions regarding the proposed NSTAR**  
19           **standby rates?**

20   A.    We have concluded that the standby rates proposed by NSTAR are seriously  
21          flawed in design, and will discourage others from pursuing cost effective CHP

DIRECT TESTIMONY OF THOMAS W. SMITH  
D.T.E. 03-121

1 projects in NSTAR's service territory. We think the proposed rates are anti-  
2 competitive and will send distorted market signals to the market. We think it  
3 is unfortunate but unavoidable that if these rates are adopted, then they will  
4 likely prevent our building occupants from enjoying the benefits of CHP. We  
5 urge the Department to reject the proposed rates and establish a process for  
6 the determination of appropriate rates.

7

8 **Q. Does this conclude your testimony?**

9 A. Yes.
